

Article 258: Quantum Worlds and Black Holes

The difference between classical physics of large objects and quantum physics of subatomic particles is that large objects seem to have inherent properties and characteristics of their own and appear to interact in predictable ways ...both of which suggest a knowable, predetermined universe which physicists can observe and measure, ...while in the subatomic world of quantum physics, substance, properties, and events are not inherent in the particles themselves ...but are intrusively imposed upon particles through the process of observing and measuring.

Now consider “the outer universe” around you which also seems to have observable and measurable inherent properties and characteristics interacting as events ...and compare that to the world within you ...which is the world in which you “truly” live, the outer universe is huge ...and your world is but a quantum particle of the whole ...and exists freely without seemingly “fixed” inherent substance, properties, and events. Like a physicist observing and measuring quantum particles ...who thus imposes properties, characteristics, and interactions upon those particles ...which creates a quantum world that matches the physicist’s beliefs and actions, your quantum world within and all around you is as you are, ...change yourself, and your quantum world changes with you, yet remains the same for other observers as they desire.

If there is general agreement and common experiences about quantum worlds, this is because, like a physicist’s published paper on his experiment and results, language conveys common experiences and results from one person to another ...who then observes his or her quantum world in the same way ...and gets the same results. Unfortunately the language and this self-perpetuating process are both seriously flawed against individuality and creating and living the quantum world you desire, ...you are merely continuing the processes and struggles of others, but as the quantum world of subatomic particles appears as the physicist measures, your quantum world will be as you truly desire ...if you will but live in that way.

“To live” means to conduct your existence in a particular manner, ...is that any different than a quantum physicist conducting his experiments in a particular way ...and creating observed results which confirm his process of measuring and observing? And were the physicist to change his experiments his quantum world would change, for he alone imposes properties and characteristics upon quantum particles which burdens the quantum world with particular interactions.

In the same way, the quantum world in which you live and constantly struggle against gets its properties, characteristics, and events from the actions of your measuring•recording devices, ...the greatest and most-intrusive of which is your language ...which imposes itself upon every aspect of the world in which you live ...and thrive and suffer depending upon your personal beliefs, actions, and experiences. Then, unfortunately, like the physicist's published paper of his experiments, you speak and write loudly~through thoughts, emotions, and behaviors~of your own beliefs and experiences, just as your ancestors did ...and passed their beliefs on to you.

In the quantum world of subatomic particles, if the physicist changes his methods of perceiving and measuring, the properties and characteristics of particles and their interactions change completely. In the same way, considering the immensity of the cosmos and the dominative nature of your particular universe, you live in a quantum world which acts and appears exactly as you believe your world to be and language that. In other words, your world, following this quantum-lived process, has the properties, characteristics, and events you mind into it.

[Isn't your quantum world accommodating?](#)

Of course the physicist in this example has the luxury to stop observing and experimenting with quantum-lived particles at any moment, while you, being in your own quantum world, continue living and experimenting in "the same ole ways" ...interrupted only by death and rebirth, ...then unfortunately, after this period of reconsideration and forgiveness, you usually continue your quantum life in the same old ways, ...therefore, your quantum world, being ever-accomodating, functioning like particles of light, offers tiny gaps at every moment so you can change your self and life completely whenever you desire ...just by illuminating matters differently.

[Your quantum world will accommodate you!](#)

But it seems you want to continue in your old beliefs and ways! In the cosmos, black holes, which are either the remains of massive stars that have collapsed in on themselves ...or are many, many stars densely packed at the center of galaxies, serve to vacuum up the remains of unnecessary matter in their vicinity. Not even light escapes a black hole's clean-up process.

In much the same way, by exploding old beliefs in cause and effect, good and evil, truth, opposing dualities, spirit and physical as different things, higher-selves, potential, disharmony and unbalance in the universe,

events happening to you, past/present/future, life's lessons, illnesses happening to you, blocked energy, and many others, we were attempting to create black holes in your life and beliefs which would clean up much of the debris of false beliefs in your life ...so you could breath easily and begin again with a new quantum self and life you truly desire. It seems though that we underestimated your desire and ability to maintain your old beliefs and ways. Would you be willing to rent a black hole for the weekend ...and live your quantum self and life with the properties, characteristics, and events you truly desire?

[That is the offering of Forever Living!](#)

Are you willing to expand yourself in your quantum world (as we suggested in Article 257) and leave your problems behind? As quantum particles take on the properties, characteristics, and events offered by the observer's perceptions and measurements, you can offer each particle, including yourself ...and any problem, the properties, characteristics, and actions you desire. In fact, you already do that, but being unaware of these personal powers and being trapped in and struggling against the duality you are living and in conflict with, you bring the properties and characteristics of conflict to yourself ...and to every particle in your world.

[Your life is certainly in need of a black hole cleaning.](#)
